

# Efficient overview diagnosis for the Orthopedic Practice

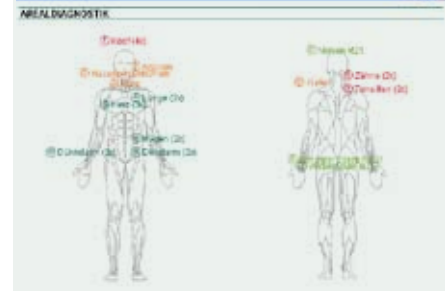

## Rapid and efficient overview diagnosis:

- Constitutional muscle analysis
- Defective position in the musculoskeletal system
- Acute ailments
- Chronic complaints
- Inflammation foci
- Autonomic nervous system
- Detoxification situation
- Stress situation

Modern orthopedic practices have seen more and more patients with chronic degenerative alterations of the musculoskeletal system. Chronic back ailments and arthropathy in particular have increased by leaps and bounds. The measures of last resort for restoring functionality to the patient's locomotor apparatus are expensive operations and prosthetics. The ultimate cause for the genesis of the disease is almost always impairment of the supply system to connective-tissue structures or auto-aggressive immune-system dysfunction. This realization strongly suggests that it's best to counter these ailments in their developmental phase, since the patient's symptomatology and/or joint alterations can be observed over a fairly long period of time – until, ultimately, the operation or prosthesis becomes unavoidable.

Diseases of the supportive and locomotor apparatus should be viewed as secondary phenomena of underlying metabolic alterations, or organ disorders radiating from the musculature. The exceptions are of course static alterations due to trauma and injury. In this respect, it is helpful for the orthopedist to know a patient's entire metabolic and organ situation, so as to intercept structure-destroying mechanisms early on.

The **Check medical sport** Method is a whole-body regulation diagnosis that primarily examines the condition and reaction mode of connective tissue. Regulation diagnosis quickly identifies "supply shortages" in connective tissue, concealed chronic inflammations, regulation of tissue acid-base balance and the state of organ functions. Secondary tonus-conditioned static alterations of the locomotor apparatus can be prognosticated via the neuronal circuits that interconnect organs and muscles, since organ disorders influence the musculature's basic tonicity. In short, this kind of regulation diagnosis gives the orthopedist insight into the causative metabolic and organ states, thus having available a tool which enables observing the patient's primary chronic concealed disorders, and which contextualizes the ailment with respect to the entire body. This then allows treating – at the root-cause level – chronic degenerative alterations to the locomotor apparatus, as well as providing additional information about interconnected muscular regions and/or their involvement in static disequilibria of the locomotor apparatus. **Check medical sport** is also a useful aid in Reha treatment, since this form of diagnosis can monitor the healing process, with the aid of which the therapist can – if necessary – identify additional measures to improve the healing process.

# A further refinement of Matrix Regeneration Therapy

## Integration of holistic therapies into a single synergistic procedure:

- Sports injuries
- Chiropractic support
- Metabolic regulation
- Connective-tissue support
- Lymph stimulation

The soft connective tissue (also known as the Matrix) plays a major role in the genesis of the classic degenerative diseases. Morphologically, the Matrix is a functional network made up of elastin, collagen and glucosamine. It binds together the vascular, nervous and lymphatic systems with the organ cells. Therefore, the health of organ cells (parenchyma) and joint structures depends crucially on the Matrix's functional ability; if it is constantly overtaxed, sooner or later the "care and feeding" of functional tissue will become impaired – with resulting chronic ailments, which we can also observe in the locomotor apparatus. That being the case, the Matrix first needs to be relieved and regenerated before these diseases can be treated successfully.

**Med matrix** integrates a number of techniques for relieving and activating the Matrix into a single device: Petechial Suction Massage, rhythmic direct-current therapy and a special kind of Systems Information Therapy in which both patient-intrinsic and homeopathic vibrational information, as well as cell- and metabolism-sustaining vibrational signals, are presented to the body. In addition, dynamic magnetic fields promote the transmittal of systems information.

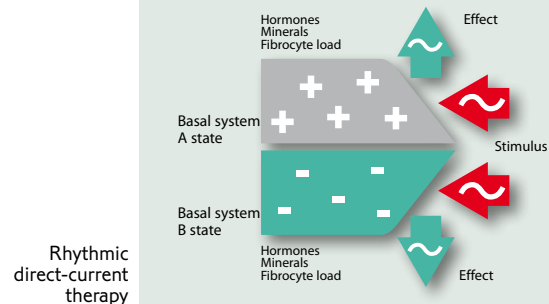

**Petechial Suction Massage** works on the patient's back with a suction probe. This intense stimulus increases blood flow, stimulates detoxification processes and activates the lymphatic and immune systems, while also breaking up muscular indurations and geloses in the tissues.

**Rhythmic Direct-Current Therapy** acts directly on anabolic/catabolic metabolism, and at the same time on the acid-base balance, since acidic valences are neutralized directly. The resulting improved state of order optimizes information flow in the tissues.

**Systems-Information-Therapy (S-I-T)** makes use of the pathological energy patterns of chronic inflammation foci and exogenous substances found in the tissues, transforming them into immune-system guiding information. This "attention signal" specifically boosts toxin elimination; chronic inflammations are activated and thereby placed in a treatable state.

**Med matrix** dissolves waste by-products and toxins, restores structures weakened by chronic inflammatory processes, and revitalizes the activity and function of immune-system and connective-tissue cells. After this basic detoxification, the organism is again in a position to initiate healing processes.

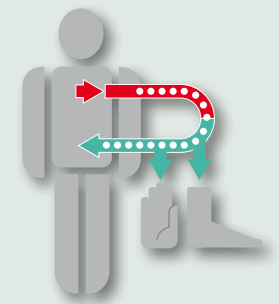

**The benefit for orthopedics consists above all of improving the supply situation in the connective tissue. It is on this basis that painful muscular indurations can be broken up, degenerative alterations beneficially influenced, and conditions improved after injury traumas.**
